EE 231A Information Theory Lecture 8

Achievability in the Channel Coding Theorem

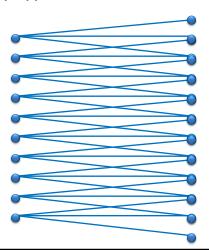

- A. Preview: Every Channel is a Noisy Typewriter, Jointly Typical Sets
- B. Random Codes and Typical Set Decoding
- C. Probability of Error

1

Part A: Preview:
Every Channel is a Noisy Typewriter
Jointly Typical Sets

Every Channel is a Noisy Typewriter.

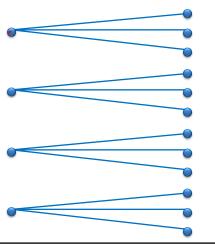

• For large block lengths, every channel looks like the noisy typewriter.

3

Code design = clever choice of inputs.

• Well-chosen inputs create essentially disjoint sets of outputs for each (well-chosen) input.

Jointly Typical Sequences

• The set $A_0^{(n)}$ of jointly typical sequences $\{x^n, y^n\}$ with respect to the distribution p(x,y) is the set of n-sequences with empirical entropies ϵ -close to the true entropies:

$$A_{0}^{(n)} = \left\{ (x^{n}, y^{n}) : \left| -\frac{1}{n} \log p(x^{n}) - H(X) \right| < \epsilon \right.$$
$$\left| -\frac{1}{n} \log p(y^{n}) - H(Y) \right| < \epsilon$$
$$\left| -\frac{1}{n} \log p(x^{n}, y^{n}) - H(X, Y) \right| < \epsilon \right\}$$

where $p(x^{n}, y^{n}) = \prod_{i=1}^{n} p(x_{i}, y_{i})$

5

$$\left| -\frac{1}{n} \log p(x^n) - H(X) \right| < \epsilon$$

$$-\frac{1}{n} \log p(x^n) - H(X) < \epsilon$$

$$\log p(x^n) + nH(X) > -n\epsilon$$

$$\log p(x^n) > -n(H(X) + \epsilon)$$

$$p(x^n) > 2^{-n(H(X) + \epsilon)}$$

$$\left| -\frac{1}{n} \log p(x^n) - H(X) \right| < \epsilon$$

$$\frac{1}{n} \log p(x^n) + H(X) < \epsilon$$

$$\log p(x^n) + nH(X) < n\epsilon$$

$$\log p(x^n) < -n(H(X) - \epsilon)$$

$$p(x^n) < 2^{-n(H(X) - \epsilon)}$$

7

Joint AEP (Thm 7.6.1)

- Let (X^n, Y^n) be sequences of length n drawn according to $p(x^n, y^n) = \prod_{i=1}^n p(x_i, y_i)$. Then
- **1.** $p((X^n, Y^n) \in A_{\epsilon}^{(n)}) \to 1$ as $n \to \infty$
- $2. \quad \left| A_{\epsilon}^{(n)} \right| \leq 2^{n \left(H(X,Y) + \epsilon \right)}$
- 3. If $(\tilde{X}^n, \tilde{Y}^n) \sim p(x^n) p(y^n)$ (i.e. \tilde{X}^n and \tilde{Y}^n are independent with the same marginals as $p(x^n, y^n)$) then $p((\tilde{X}^n, \tilde{Y}^n) \in A_{\epsilon}^{(n)}) \le 2^{-n(I(X;Y)-3\epsilon)}$.

Proof of 3

$$p((\tilde{X}^n, \tilde{Y}^n) \in A_{\epsilon}^{(n)}) = \sum_{(x^n, y^n) \in A_{\epsilon}^{(n)}} p(x^n) p(y^n)$$

$$\leq |A_{\epsilon}^{(n)}| 2^{-n(H(X) - \epsilon)} 2^{-n(H(Y) - \epsilon)}$$

$$\leq 2^{n(H(X, Y) + \epsilon)} 2^{-n(H(X) - \epsilon)} 2^{-n(H(Y) - \epsilon)}$$

$$= 2^{-n(I(X; Y) - 3\epsilon)}$$

How many typical sequences?

- $\sim 2^{nH(X)}$ typical X sequences
- $\sim 2^{nH(Y)}$ typical Y sequences
- $\sim 2^{nH(X,Y)}$ typical (X,Y) sequences
- Not all pairings of a typical X sequence with a typical Y sequence produce a typical (X,Y) sequence.
- In fact, when the X and Y sequences are chosen independently, the probability is $\sim 2^{-nI(X;Y)}$

LO

Part B:

Random Codes and Typical Set Decoding

11

Proof of achievability in channel coding theorem

Now we prove part 1 of channel coding theorem:
 All rates R<C are achievable.

Random Code Generation

- Fix p(x). Generate a $(2^{nR}, n)$ code \mathcal{C} at random according to p(x).
- Specifically, we generate 2^{nR} codewords according to $p(x^n) = \prod_{i=1}^n p(x_i)$.

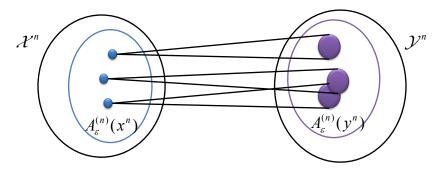

$$C = \begin{bmatrix} x_1(1) & x_2(1) & \dots & x_n(1) \\ \vdots & \vdots & \ddots & \vdots \\ x_1(2^{nR}) & x_2(2^{nR}) & \dots & x_n(2^{nR}) \end{bmatrix} \qquad p(C) = \prod_{w=1}^{2^{nR}} \prod_{i=1}^n p(x_i(w))$$

13

Typical Set Decoding

- Maximum likelihood decoding is optimal, but we will use decoding based on typical sets because it makes our analysis easier:
- Receiver declares \hat{w} was sent if
 - **-1)** $(X^n(\hat{W}), Y^n) \in A_{\hat{U}}^{(n)}$
 - 2) There is no other index k with $(X^n(k), Y^n) \in A_0^{(n)}$.
- If no such \hat{W} exists declare an error.

Typical Set Decoding

• Typical set decoding:

$$\hat{W}(Y^n) = \begin{cases} W_i & \text{if } \left(X^n(W_i), Y^n\right) \in A_{0}^{(n)} \text{ and } \left(X^n(W_j), Y^n\right) \notin A_{0}^{(n)} \text{ for } j \neq i \\ & \text{decoding failure otherwise} \end{cases}$$

15

The Game Plan

- We will compute the average probability of error, averaging over all random codes, under typical set decoding.
- This probability of error will converge to zero as $n \rightarrow \infty$ guaranteeing the existence of at least one good code.

Part C: Computing probability of error

17

Probabilities of error

• Probability of error for a specified input:

$$\lambda_i = P(\hat{W} \neq i \mid x^n = x^n(i))$$

- Maximal probability of error $\lambda^{(n)} = \max_{i \in \{1,2,\dots,2^{nR}\}} \lambda_i$
- Average prob. of error for a specified ${\cal C}$

$$P_e^{(n)}(\mathcal{C}) = \frac{1}{2^{nR}} \sum_{k=1}^{2^{nR}} \lambda_W(\mathcal{C})$$

• Average prob. of error over all possible \mathcal{C} 's.

$$P(\mathcal{E}) = \sum_{\mathcal{C}} P(\mathcal{C}) P_e^{(n)}(\mathcal{C})$$

We only need to consider a single input.

$$P(\mathcal{E}) = \sum_{\mathcal{C}} P(\mathcal{C}) P_e^{(n)}(\mathcal{C})$$

$$= \sum_{\mathcal{C}} P(\mathcal{C}) \frac{1}{2^{nR}} \sum_{w=1}^{2^{nR}} \lambda_w(\mathcal{C})$$

$$= \frac{1}{2^{nR}} \sum_{w=1}^{2^{nR}} \sum_{\mathcal{C}} P(\mathcal{C}) \lambda_w(\mathcal{C})$$

$$= \frac{1}{2^{nR}} \sum_{w=1}^{2^{nR}} \sum_{\mathcal{C}} P(\mathcal{C}) \lambda_w(\mathcal{C})$$
same for every W

$$= \sum_{\mathcal{C}} P(\mathcal{C}) \lambda_1(\mathcal{C})$$

$$= P(\mathcal{E} \mid W = 1)$$

19

Symmetry of codes

- The symmetry of the code construction guarantee that for every code C, there are 2^{nR} ! equally likely codes that are simply permutations (same codewords, different mapping of inputs to codewords).
- Considering a single index (input) over all 2^{nR} ! permutations provides the same average as considering all indices over all permutations. (or all indices on a single permutation).

Example of why one input is sufficient.

- Let $\mathcal{X} = \{a, b, c, d\}$ n = 1 $2^{nR} = 3$
- There are 24 possible codes C, each with probability 1/24.

$$\begin{bmatrix} a \ b \ c \end{bmatrix}^{T} \\
\begin{bmatrix} a \ c \ b \end{bmatrix}^{T} \\
\begin{bmatrix} b \ d \ c \end{bmatrix}^{T} \\
\begin{bmatrix} a \ d \ c \end{bmatrix}^{T} \\
\begin{bmatrix} a \ d \ c \end{bmatrix}^{T} \\
\begin{bmatrix} a \ d \ d \end{bmatrix}^{T} \\
\begin{bmatrix} b \ d \ a \end{bmatrix}^{T} \\
\begin{bmatrix} b \ d \ a \end{bmatrix}^{T} \\
\begin{bmatrix} c \ d \ a \ d \end{bmatrix}^{T} \\
\begin{bmatrix} c \ d \ a \ c \end{bmatrix}^{T} \\
\begin{bmatrix} c \ d \ a \ d \end{bmatrix}^{T} \\
\begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{T} \\
\end{bmatrix} = \begin{bmatrix} d \ a \ b \end{bmatrix}^{$$

21

Discussion of Example

- We have divided these codes into 4 sets that are mutually exclusive and collectively exhaustive.
- Each set contains all the permutations that use the same set of codewords.
- Within each permutation, $\lambda_i = \lambda_j$ for all i, j.
- We can do this for any set of random codes used in the channel coding theorem proof.
- The codeword error $\lambda_{W}(\mathcal{C})$ is a only a function of the codeword for W and the set of other codewords in \mathcal{C} .

Error Events and Correct Transmission

• Define the following events:

$$E_i = \{(X^n(i), Y^n) \in A_{0}^{(n)}\}, \quad i = 1, ..., 2^{nR}$$

- E_i is the event that the $i^{\rm th}$ codeword is typical with the received sequence.
- E_i is an error unless i=1.

2:

Computing Probability of Error

$$P(\mathcal{E} \mid W = 1) = P(E_1^c \cup E_2 \cup E_3 \cup ... \cup E_{2^{nR}})$$

$$\leq P(E_1^c) + \sum_{i=2}^{2^{nR}} P(E_i)$$

$$P(E_1^c) \to 0$$
 as $n \to \infty$

$$P(E_i) \le 2^{-n(I(X;Y)-3\epsilon)}$$
 for $i \ne 1$

Error goes to zero if R < I.

$$P(\mathcal{E}) = P(\mathcal{E} \mid W = 1)$$

$$\leq P(E_1^c) + \sum_{i=2}^{2^{nR}} P(E_i)$$

$$\leq \acute{\mathbf{U}} + \sum_{i=2}^{2^{nR}} 2^{-n(I(X;Y) - 3\acute{\mathbf{U}})} \text{ for } n \text{ sufficiently large}$$

$$= \acute{\mathbf{U}} + (2^{nR} - 1)2^{-n(I(X;Y) - 3\acute{\mathbf{U}})}$$

$$\leq \acute{\mathbf{U}} + 2^{-n(I(X;Y) - (R + 3\acute{\mathbf{U}}))}$$

$$\leq 2\acute{\mathbf{U}} \text{ for } R < I(X;Y) - 3\acute{\mathbf{U}}$$

• If R < I(X;Y) we can always choose ϵ and n so that the average probability is less than 2ϵ , i.e. arbitrarily small.

Error goes to zero if *R*<*I*.

$$\begin{split} P(\mathcal{E}) &= P(\mathcal{E} \mid W = 1) \\ &\leq P(E_1^c) + \sum_{i=2}^{2^{nR}} P(E_i) \\ &\leq \epsilon + \sum_{i=2}^{2^{nR}} 2^{-n(I(X;Y) - 3\epsilon)} \quad \text{for } n \text{ sufficiently large} \\ &= \epsilon + (2^{nR} - 1)2^{-n(I(X;Y) - 3\epsilon)} \\ &\leq \epsilon + 2^{-n} \big(I(X;Y) - (R + 3\epsilon) \big) \\ &\leq 2\epsilon \quad \text{for } R < I(X;Y) - 3\epsilon \end{split}$$

• If R < I(X;Y) we can always choose ϵ and n so that the average probability is less than 2ϵ , i.e. arbitrarily small.

Maximizing I gives C.

• Now choose p(x) to maximize I(X;Y) and everything we did works for C in place of I(X;Y).

27

At least one good code...

- Since the average probability of error overall codes is small $<2\epsilon$, there exists at least one code C^* that achieves $P_e^{(n)} < 20$ by itself.
- For C^* , discard the half of the codewords with the largest λ_i 's.
- Because the average of the λ_i 's is 2ϵ , the best half must have all their λ_i 's less than 4ϵ .
- Hence the best half of C^* has maximal $\lambda^{(n)} < 40$. We have reduced rate negligibly from R to $R - \frac{1}{n}$.
