#### Parallel Gaussian channels

2

Parallel Gaussian channels: Assume that there are k parallel Gaussian channels shown above. For channel  $j,\ 1\leq j\leq k$ ,

$$Y_j = X_j + Z_j, \quad Z_j \sim \mathcal{N}(0, N_j)$$

where  $Z_j$  is independent from channel to channel.

**Goal**: distribute a total power P among k channels to maximize the capacity. ECE 231A Discussion, Spring 2020

### Water-filling for parallel Gaussian channels

#### Capacity of k parallel Gaussian channels:

$$\begin{split} C &= \max_{f(x_1, \dots, x_k): \sum_{i=1}^k \mathbb{E}[X_i^2] = P} I(X_1, X_2, \dots, X_k; Y_1, Y_2, \dots, Y_k) \\ &= \sum_{i=1}^k \frac{1}{2} \log \left( 1 + \frac{(\nu - N_i)^+}{N_i} \right) \end{split}$$

where  $\nu$  is chosen so that  $\sum_{i=1}^{k} (\nu - N_i)^+ = nP$ . (Water-filling process)

**Proof**: First, we can show that  $\underbrace{I(X_1,\ldots,X_k;Y_1,\ldots,Y_k)}_{\text{where }P_i\triangleq\mathbb{E}[X_i^2].\text{ Next, solving for capacity is equivalent to}^k \underbrace{h(Y_i)-h(Z_i)}_{\text{optimized}} \leq \sum_{i=1}^k \frac{1}{2}\log\left(1+\frac{P_i}{N_i}\right)$ 

$$\max_{P_1,\dots,P_k} \sum_{i=1}^k \frac{1}{2} \log \left( 1 + \frac{P_i}{N_i} \right) \mathcal{J}(P_i \dots P_i, \lambda)$$
s.t. 
$$\sum_{i=1}^k \frac{P_i \le P}{P_i \ge 0, \forall i = 1,\dots,k}$$

$$= \sum_{i=1}^l \frac{P_i \le P}{P_i \ge 0, \forall i = 1,\dots,k}$$

Differentiating the Lagrangian, we have  $\frac{1}{2}\frac{1}{P_i+N_i}+\lambda=0$  or  $P_i=(\nu-N_i)^+$ . ECE 231A Discussion, Spring 2020

### Water-filling algorithm

**Question**: How to efficiently find the "water level"  $\nu$ ?

```
Analysis: Let N_1 \leq N_2 \leq \cdots \leq N_k. Define A \triangleq \{i : P_i \geq 0\}. If given A,
\sum_{i=1}^k P_i = P, then \sum_{i \in A} (\nu - N_i) = P. Namely, \nu = \frac{1}{|A|} (P + \sum_{i \in A} N_i).
Additionally, if i \in A, then \forall i < j, i \in A.
Water-filling algorithm: \beta_1 = \sqrt{-N_1} > \beta_2 > 0
Require: Assume that N_1 \leq N_2 \leq \cdots \leq N_k.
  1: Set A \leftarrow \{1, 2, ..., k\}, i \leftarrow k.
  2: F ← False:
  3: while F = \text{False do}
 4: \nu \leftarrow \frac{1}{|A|} \left( P + \sum_{i \in A} N_i \right);
  5: P_i \leftarrow \nu - N_i, i \in A:
  6: if P_i > 0, \forall i \in A then
          F \leftarrow \mathsf{True}:
  7:
  8. end if
  9: A \leftarrow A \setminus \{i\};
10. i \leftarrow i - 1:
11: end while
```

# Sufficient statistic

$$\theta \rightarrow \times \rightarrow \tau(\kappa)$$

**Sufficient statistic**: T(X) is a sufficient statistic relative to the family  $\{f_{\theta}(x)\}$ 

**Gaussian case**: Let  $Y_1 = X + Z_1$ ,  $Y_2 = X + Z_2$ , where  $Z_i \sim \mathcal{N}(0, \sigma^2)$ ,  $Z_1$  and  $Z_2$  are independent. Then  $T=V_1+V_2$  is a sufficient statistic for X.

**Proof**: First,  $T \sim \mathcal{N}(2X, 2\sigma^2)$ . Need to show  $f(Y_1, Y_2 | T, X) = f(Y_1, Y_2 | T)$ . Given  $X = \overline{x}$ ,

Given 
$$X = x$$
,
$$\underbrace{\frac{f(y_1, y_2 | x, t)}{f(t | x)}}_{:} = \underbrace{\frac{f(y_1, y_2 | x)f(t | y_1, y_2, x)}{f(t | x)}}_{f(t | x)} = \underbrace{\frac{f(y_1, y_2 | x)f(t | y_1, y_2, x)}{f(t | x)}}_{:}$$

$$= \underbrace{\frac{f(y_1 | x)f(y_2 | x)\delta(y_1 + y_2 - t)}{f(t | x)}}_{:}$$

 $= \frac{1}{\sqrt{-2}} \exp\left(-\frac{(y_1 - y_2)^2}{4\sigma^2}\right) \delta(y_1 + y_2 - t).$ 

where  $f(y_i|x) = \frac{1}{\sqrt{2\pi}\sigma} \exp(-\frac{(y_i-x)^2}{2\sigma^2})$ , i=1,2,  $f(t|x) = \frac{1}{\sqrt{4\pi\sigma^2}} \exp(-\frac{(t-2x)^2}{4\sigma^2})$ . Thus,  $f(y_1, y_2|x, t)$  does not depend on x,

$$f(y_1,y_2|t) = \int_x f(y_1,y_2|x,t) f(x|t) \,\mathrm{d}x = f(y_1,y_2|t,x).$$
 ECE 231A Discussion, Spring 2020 
$$\int f(y_1,y_2|t,x) \,\mathrm{d}x = f(y_1,y_2|t,x).$$

# HW problem 9: the two-look Gaussian channel

Consider the ordinary Gaussian channel with two correlated looks at X, that is  $Y = (Y_1, Y_2)$ , where

$$Y_1 = X + Z_1$$
  $Y_1 = X + Z_2$   $Y_2 = X + Z_2$   $Y_2 = X + Z_2$   $Y_3 \sim N(0, P+N)$ 

with power constraint P on X, and  $(Z_1, Z_2) \sim \mathcal{N}_2(0, K)$ , where

$$K = \begin{bmatrix} N & N\rho \\ N\rho & N \end{bmatrix} \qquad (Y_{\epsilon}, Y_{\epsilon}) \sim \begin{bmatrix} M_{\epsilon}P_{\epsilon} & P_{\epsilon}P_{\epsilon} \\ N\rho & N \end{bmatrix}$$

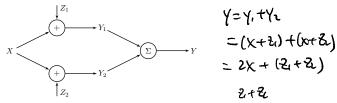

Find the capacity of this channel.

the capacity of this channel.

$$I(X; Y_1, Y_2) = h(Y_1, Y_2) - h(Y_1, Y_2) = f(X + Z_1 + Z_2 +$$

# Exercise 1: multipath Gaussian noise channel

Consider a Gaussian noise channel with power constraint P, where the signal takes two different paths and the received signals are added together at the antenna.

Find the capacity of this channel if  $Z_1$  and  $Z_2$  are jointly normal with

covariance matrix
$$K_{Z} = \begin{bmatrix} \sigma^{2} & \rho \sigma^{2} \\ \rho \sigma^{2} & \sigma^{2} \end{bmatrix} \cdot \underbrace{\mathbb{E}(1 \times 1 - 4 \times 1)} - \mathbb{E}(1 \times 1 - 4 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} - \mathbb{E}(1 \times 1 \times 1) = \underbrace{\mathbb{E}(1 \times 1 \times 1)} -$$

### Exercise 2: a mutual information game

Consider the following channel

In this problem, we shall constrain the signal power and the noise power,

$$\mathbb{E}[X] = 0, \quad \mathbb{E}[X^2] = \underline{P},$$
  
 $\mathbb{E}[Z] = 0, \quad \mathbb{E}[Z^2] = \underline{N},$ 

and assume that X and Z are independent, the capacity is I(X;X+Z). Now for the game,

- 1. the noise player chooses a distribution on Z to minimize I(X;X+Z). 2. the signal player chooses a distribution on X to maximize I(X;X+Z).
- 2. the signal player chooses a distribution on X to maximize I(X; X + Z). Letting  $X^* \sim \mathcal{N}(0, P)$ ,  $Z^* \sim \mathcal{N}(0, N)$ . Show that Gaussian  $X^*$  and  $Z^*$  satisfy the saddlepoint conditions.

$$I(X; X + Z^*) \le I(X^*; X^* + Z^*) \le I(X^*; X^* + Z).$$

**Hint**: The entropy power inequality: for two n-dimensional, independent vectors  $X^n, Y^n$ ,

$$2^{\frac{2}{n}h(X^n+Y^n)} \geq 2^{\frac{2}{n}h(X^n)} + 2^{\frac{2}{n}h(Y^n)} + 2^{\frac{2}{n}h(Y^n)} \geq 2^{\frac{2}{n}h(X^n)} + 2^{\frac{2}{n}h(X^n)} + 2^{\frac{2}{n}h(X^n)} + 2^{\frac{2}{n}h(X^n)} \geq 2^{\frac{2}{n}h(X^n)} + 2^{\frac{2}{n}h(X^n)} +$$

$$I(X; X+2^{*}) - h(X+2^{*}|X)$$

$$= h(X+2^{*}) - h(2^{*})(X+2^{*}) = pen$$

$$\leq h(X^{*}+2^{*}) - h(2^{*})$$

$$= I(X^{*}; X^{*}+2^{*})$$

$$= I(X^{*}; X^{*}+2^{*})$$

$$= h(X^{*}+2) - h(X^{*}+2|X^{*})$$

$$= h(X^{*}+2) - h(2)$$

$$|x| = h(X^{*}+2) - h(2)$$

$$|x| = h(X^{*}+2) - h(2)$$

$$|x| = h(X^{*}+2) = \frac{1}{2}h(X^{*}) + 2^{2h(2^{*})} + 2^{2h(2^{*})}$$

$$|x| = \frac{1}{2}h(2^{2h(X^{*})} + 2^{2h(2^{*})}) - h(2^{*})$$

$$= \frac{1}{2} \frac{1}{3} \left( (12e) \frac{1}{3} + (22e) \frac{1}{3} \frac{1}{3} \right) - \frac{1}{2} \frac{1}{3} (22e) \frac{1}{3} \frac{1}{3}$$

$$= \frac{1}{2} \frac{1}{3} \left( 1 + \frac{P}{3} \right) > \frac{1}{2} \frac{1}{3} \frac{1}{3} \left( 1 + \frac{P}{N} \right)$$

$$= \frac{1}{2} \left( \frac{1}{N} + \frac{P}{N} \right)$$

min 
$$\left(1+\frac{p}{g(4)}\right)$$
  $\Rightarrow$  max  $g(3)=\frac{1}{22e}$   $\Rightarrow$  max  $h(2)$
